

---

A film is a piece of cinema that is intended to be watched through a screen by an audience. It can be a story that unfolds in front of the viewer or one that is created solely within the imagination of the director. Filmmaking has developed into an extremely popular pastime over the centuries, especially with its many applications in advertising, television and film studios, and arts such as cinematography and animation. However, one film genre in particular has been gaining prominence recently: movies about digital divide. Since the 1930s, writers and directors have been using film to tackle social issues in their work. A common theme of these movies is the disparity between rich and poor, or how unfair it is that one group has more than another. Digital divide films are concerned with the gap between rich and poor when it comes to computer technology. A film in this genre typically portrays a family who cannot afford an expensive computer or internet connection, leaving them out of touch with the rest of society. One example of this type of film is "Primer", which was released in 2004 by writer/director/editor Shane Carruth. In the movie, a couple of friends create a contraption that allows them to see into the future. In one scene towards the beginning of the film, they present their invention to a big corporation. The woman says "...and we're going to show you just how amazing our machine is...". The two men take turns explaining how their device works while sitting in front of a twenty-five-foot screen behind glass. The camera holds on one man as he explains what he sees on his own computer screen while sitting next to a room full of high-end computers and programmers. The camera then switches to another man who is looking at his own computer screen and explaining what he sees there. It then cuts to a picture of a woman's face on a laptop screen behind him. In this scene, the camera shows the woman in the audience typing on the computer. While she is typing, she talks to her husband about how beautiful their home is and how she loves being with him when he comes home from work. In another scene, they show how their device can be used with dumb cams, i.e., ordinary cameras that do not have a computer in them. They show a man taking pictures of his baby while it sleeps next to him in his crib. The camera cuts to a man at home on his computer. It shows him taking pictures of his baby through his laptop, who is sleeping in the same crib, only now it is hundreds of miles away. The film ends with the camera cutting to a picture of the man's wife, who says she wants to have another child. "Tashan" takes place in an unnamed third-world country where economic inequality is still very high. Although this movie was not made for political reasons or to make any type of statement about digital divide, it shares many similarities with films that are made for those reasons.
